LOOKING FOR Cats and Dogs

Studying accuracy of canine scent detection to identify cancer

The Study

This study investigates whether Beagle dogs can detect samples from patients with cancer via scent.

Who Qualifies

Any healthy dog or cat, 6 years old or younger. Any dog or cat diagnosed with specific types of cancer or other diseases prior to receiving treatment.

What Happens

Five saliva swabs will be obtained from patients enrolled in this study.

Why Participate

The goal of this study is to determine if specific proteins can be identified by scent, which could aid in cancer detection.

More Information

For more information regarding this study, please contact Dr. MacKenzie Pellin at mackenzie.pellin@wisc.edu or Amanda Brooks at 608-890-3484.
